Department of Prosthodontics
Chair of Dental, Oral, and Maxillofacial Medicine – especially Prosthetic Dentistry

Address
Glückstraße 11
91054 Erlangen
Phone: +49 9131 8533604
Fax: +49 9131 8536781
www.prothetik.uk-erlangen.de

Director
Prof. Dr. med. dent. Manfred Wichmann

Contact
Claudia Ehrhardt
Phone: +49 9131 8533604
Fax: +49 9131 8536781
claudia.ehrhardt@uk-erlangen.de

Research focus
- Dental biomechanics
- Psychogenic influence/quality of life and complementary medical procedures in dental questions
- Optical 3D-measurement technique in dentistry
- CAD/CAM research laboratories
- Prosthodontics and implant therapy based on three-dimensional imaging

Structure of the Department
Professorships: 2
Personnals: 49
- Doctors (of Medicine): 17
- Scientists: 12 (thereof funded externally: 0)
- Graduate students: 10

Clinical focus areas
- Implant prosthetics
- Fixed and removable prosthetic
- Diagnosis and treatment of temporomandibular joint dysfunction (TMJD)
- Hypnosis and acupuncture treatment
- Esthetic dentistry
- Prosthetic rehabilitation with epthesis
- Prosthetic rehabilitation of children

Research
Due to the high demands and quality standards of research projects, synergistic effects of highly qualified specialists are mandatory. This is reflected in the general orientation and a focus on future demands as well as in extensive cooperation with other fields of research. One key focus of research is the aging population and the resulting demographic changes and the investigation of the relationship between oral and general health.

Dental biomechanics
PI: Dr. R. Matta, Dr. C. Motel
Due to the lack of suitable metrological methods, it has so far been possible only to a very limited extent and in individual cases with very complex experimental set-ups to represent and quantitatively determine biomechanical influences in the oral cavity. A large number of theories on a wide variety of questions have so far neither been clearly confirmed nor refuted scientifically. The aim of the research area is to optimize a renewed, non-contact 3D optical deformation measurement system for clinical in vivo application on patients in order to enable quantitative measurement of biomechanical influences in the oral cavity in real time in future studies and to initiate innovative questions through in vitro investigations.

In ongoing and completed in vitro investigations in the fields of material science and biomechanics, the previously existing system has proven its worth. In addition, the first in vivo pilot studies on force-correlated tooth movements have demonstrated a corresponding clinical application.

An innovation introduced in the reporting period was the investigation of deformations of implants, superstructures, and bone under simulated chewing force, which allows dynamic changes on surfaces to be represented with high precision. For this purpose, the current version of the ARAMIS system from GOM GmbH, which is innovative in dental research, was purchased and already established through its presentation at a specialist congress. The first goal here was to demonstrate the advantages in the field of dental biomechanics over the conventional measuring methods currently used in this field, such as strain gauges. This method opens up a wide range of scientific applications for the future.

Optical 3D-measurement technique in digital dentistry
PIs: Dr. R. Matta, Dr. C. Motel
There is currently a change in technology in the field of dental impression taking. Digital impressions are becoming more established and their indication has been expanded to include multi-unit bridges, extensive implant restorations and bite registration as a result of constant technological progress from single-tooth crowns. This research area evaluates the accuracy of digital impressions taken by intraoral scanners - also in comparison with conventional methods. This involves investigating which scan protocols, i.e. which sequence of work steps, can lead to the best possible digital imaging of the oral situation. In addition, various parameters of digital impression taking are considered, such as the geometry of the scan bodies required for digital implant impression taking and the various intraoral scanners available on the market, in order to assess the quality and reproducibility of this technology.

Psychogenic impact/quality of life and complementary medical procedures in dental questions
PI: Prof. Dr. S. Eitner
This area of research is divided in two main focal points. The first focal point evaluates psychogenic influence on treatment planning and outcome of dental disease patterns with a psychogenic background. Among other factors, the subject’s appraisal of his own body can influence dental questions. Besides, the etiological correlation of gag reflexes during dental treatment, the influence of stress and clinical pictures on fear, depressive states, and social parameters are evaluated, too.

CAD/CAM research laboratories
PIs: Dr. R. Matta, Dr. L. Wolf
Industrial CAD/CAM manufacturing technologies have gained significant market share in producing dental restorations in recent years, primarily due to standardized product quality and precision as well as economic processing routine in dental laboratories. To achieve high quality and precision, product aligned process routes are a mandatory prerequisite. The research group focuses on segmenting CAD/CAM processes and assessment of the impact on the overall quality. In addition to recently developed methodologies for 3D-display and analysis of microgaps in con-
Conventional dental restorations, new protocols are in development for a clinical assessment of fit of implant retained superstructures. The research laboratories are equipped with state-of-the-art industrial non-contact scanners and necessary analytical software programs. As high strength oxide ceramics are applied more frequently as framework materials in dentistry, several research projects assess the clinical application and factors influencing long-term success.

Comparison of the accuracy of CAD/CAM implant template to virtual planning

Prosthodontics and implant therapy based on three dimensional imaging

PI: Dr. R. Matta, Dr. A. Seidel

The three dimensional (3D) imaging becomes more and more important for the modern implant and prosthodontic therapy plan. This includes the Computer Tomography (CT), the Cone Beam Computer Tomography (CBCT), and the intraoral digital impression. The focus is on the 3D accuracy of the X-ray imaging. In addition, the impact of different dental implant materials on the appearance of artifacts in the 3D virtual model is investigated. In this context a new method for the 3D evaluation of CT and CBCT images has been developed.

Teaching

The main focus of traditional prosthodontic education has shifted from a technically oriented approach towards an interdisciplinary treatment approach. Prophylaxis and biology are in the focus as well as minimally invasive treatment concepts. Clinically relevant topics are introduced into the preclinical curriculum, focusing on biologic interactions and material properties. While theoretical knowledge remains integral part of dental education, manual manufacture of dental restoration will be taught only exemplarily. Two new extra-curricular courses have been introduced. Using these elective courses theoretical principles of digital dentistry as well as its forward-looking treatment options were taught for students of clinical prosthodontic courses.
