Department of Surgery
Division of Transfusion Medicine and Hemostaseology

Address
Krankenhausstraße 12
91054 Erlangen
Phone: +49 9131 8536972
Fax: +49 9131 8536973
www.transfusionsmedizin.uk-erlangen.de

Head of Division
Prof. Dr. med. Holger Hackstein, MBA

Contact
Prof. Dr. med. Robert Zimmermann
Phone: +49 9131 8542110
Fax: +49 9131 8536973
robert.zimmermann@uk-erlangen.de

Research focus
- Development of new minimally invasive photopheresis methods
- Functional modulation of dendritic cells
- Collection of monocytes for the generation of dendritic cells (DC)
- Clinical research related to hemostaseology
- Clinical research related to hemotherapy
- Mesenchymal stromal cells (MSC)
- Optimization of collection procedures to get regulatory T cells (Tregs)
- Legislation of transfusion

Structure of the Division
Professorships: 1
Personnel: 76
• Doctors (of Medicine): 6
• Scientists: 6 (thereof funded externally: 0)
• Graduate students: 10

Clinical focus areas
• Clinical transfusion medicine
• Blood component supply
• Immunohematological and hemostaseological diagnostics
• Outpatient and inpatient coagulation counseling
• Production and storage of stem cell preparations
• Minimally invasive photopheresis methods

Research
Research in the Division of Transfusion Medicine and Hemostaseology focuses on the characterization of specific blood components, stem cell concentrates, and new experimental cellular preparations. Clinical problems with respect to hemotherapy and coagulation management are also investigated. In the GMP laboratory of the Division, interdisciplinary experimental preparations for innovative clinical trials are produced and tested (Advanced Therapy Medicinal Products, ATMP).

Development of new minimally invasive photopheresis methods
PI: Prof. Dr. H. Hackstein
Current standard photopheresis methods are only able to treat small children to a limited extent. The project group has modified the clinical photopheresis methods and is developing new minimally invasive treatment methods so that critically ill infants can also be successfully treated with a graft versus host disease after bone marrow transplantation. This new minimally invasive photopheresis procedure is characterized by the fact that only very small amounts of blood (100-200 ml whole blood) are required and thus even very small children or vital unstable, critically ill adult patients with contraindications to classical apheresis can be treated.

Functional modulation of dendritic cells
PI: Prof. Dr. H. Hackstein
The project group is investigating pharmacological substances that control or block key functions of dendritic cells with the aim of activating or blocking antigen-specific immune responses. The immunosuppressant rapamycin, for example, is the first clinically used drug that inhibits both, antigen uptake and mobilization of dendritic cells in vitro and in vivo. Current research projects investigate the role of RNA-editing enzymes in the hematopoietic differentiation of dendritic cells and translational protocols for the accelerated differentiation of monocytes in dendritic cells.

Collection of monocytes for the generation of dendritic cells (DC)
PI: Prof. Dr. E. Strasser
Circulating monocytes are precursors of DC, which play a key role in the immune system’s function by presenting antigens to specific lymphocytes. The collection and cultivation of these cells enables the development of new strategies in the treatment of malignant diseases. Members of the Division of Transfusion Medicine and Hemostaseology cooperate with colleagues from the Department of Dermatology to adjust the collection procedures optimally to the specific clinical and experimental demands of procedures aimed at the cultivation, expansion, and priming of DC.

Clinical research related to hemostaseology
PI: Prof. Dr. R. Zimmermann, Prof. Dr. E. Strasser
Other research interests include thrombophilia, traveller’s thrombosis, and hemostasis dysfunctions resulting in bleeding disorders. Other current study objectives are preanalytical determinants of fibrinolysis tests, hemostasis tests in systemic lupus erythematoses, and other currently relevant topics.

Clinical research related to hemotherapy
PI: Prof. Dr. V. Weisbach, Prof. Dr. R. Zimmermann, Prof. Dr. E. Strasser
We examine antibodies against red cell antigens, characterize factors influencing the quality of stored red cell concentrates, and study the complex dysfunctions of the coagulation system.

Mesenchymal stromal cells (MSC)
PI: Prof. Dr. V. Weisbach
Mesenchymal stromal cells (MSC) are the predecessors of osteoblasts, chondrocytes, and adipocytes. The term “MSC” especially covers cells cultivated and expanded ex vivo. These cells are a mixture of stem and progenitor cells up to mature stroma cells and are named MSC according to a definition of the International Society of Cellular Therapy. It is expected that MSC will play a major role in future applications of regenerative medicine. The main focus of the working group is the preparation, characterization, and expansion of MSC, especially from placental tissues.

Optimization of collection procedures to get regulatory T cells (Tregs)
PI: Prof. Dr. E. Strasser, PD Dr. J. Strobel
T cells play an important role in adoptive immune response in many diseases (infectious and inflammatory diseases, tumors). DC act as antigen presenting cells for specific T cells activation. The collection of circulating T cells as well as the culture and expansion of T cells, especially regulatory T cells (Tregs), enables the development of new strategies for the anti-inflammatory and immunosuppressive therapies. Members of the Division of Transfusion Medicine and Hemostaseology cooperate with colleagues from the departments of Medicine 1, Dermatology, and Medicine 5 to optimally adjust the collection procedures to the specific clinical and experimental demands of procedures aimed at the cultivation and expansion of
Tregs. In the context of cell preparation, analysis of factors responsible for cell damage (cell apoptosis and necrosis) is relevant to optimize the quality of leukocyte products.

Legislation of transfusion

PI: Prof. Dr. R. Zimmermann

Under the auspices of the Legal Counsel and Managing Director of the UK Erlangen, Dr. A.W. Bender, the Division of Transfusion Medicine and Hemostaseology is involved in publications on the legislation and law of blood transfusion in Germany. In the center of attention is the book “Transfusion Law”, published by the Wissenschaftliche Verlagsgesellschaft Stuttgart, that has become the benchmark in this field of law and has found its way into the jurisdiction of the German Federal High Court of Justice. Alongside, book contributions and articles on different aspects of the legislation and law of blood transfusion are published.

Teaching

The Division of Transfusion Medicine and Hemostaseology is involved in compulsory and optional courses in the curricular teaching of Medicine and Dentistry. Particularly noteworthy is the interdisciplinary teaching of laboratory diagnostics and clinical pathology together with the Department of Medicine 5 and the Clinical Chemistry Laboratory and the participation in the block training in surgery.

We supervise MD and PhD theses.
